Reflections on academic evaluation and academic production: Taking economics as an example

Chen Weixing

Academic evaluation should strive for fair, academic development and raise the level of academic research. The evaluation criteria and methods, however, differ from one country to another. The purpose of the evaluation is to provide feedback to the researchers. But because their research on market economies is not always reproducible, the evaluation criteria can now be assessed and their influence evaluated.

The significance of evaluation criteria

Before assessing results, we shall first examine the criteria of present academic evaluation and prove their efficacy in these situations. Since academic evaluation is not like quality control in manufacturing, however. The evaluation criteria should be changed to be more flexible.

Since we cannot use the criteria that to ensure the quality and control the quality of academic research, we need to develop our own criteria.

Very obviously international evaluation criteria do not attach importance to the factors of serving the needs and local society. The problems that international journals are not concerned about, these problems are mostly local. The quality of scientific research is evaluated by the quality of the publication and how widely the paper is cited. The impact factors of social sciences are also based on these criteria. The way in which the research is used is less important. Thanks to the development of the Internet, more scholarly journals are published online. This means that the criteria of academic evaluation are changing.

Taking economics in Taiwan as an example

Within Taiwan, the economic studies developed much earlier and it is the academic discipline that has the highest citation rate. The studies there have obtained a Doctorate in the USA. We could say that Taiwan has the highest level of academic studies in the world. When we count the number of articles that have been listed in the SCI database, we could see that the number of articles that have been published in the USA. Economic studies are the most advanced and knowledgeable discipline under the current social science in Taiwan.

However, in the research on market economy, where research is often reproducible, the local society has not become an important goal and has not been seriously considered in the process of establishing evaluation criteria. The goals of modernization and catching up with the USA, however, is still an important goal, which should be reflected in the demands of using economic data in Taiwan. As a result, we are running in a contradictory situation. On the one hand, we need to follow the international academic standards, and on the other, it is important to establish a system that is suitable for our own situation.

Where are we, in our academic studies if we compare our academic studies in the national market. The evaluation criteria of economic studies may not be suitable for the international academic community. This is mainly because the international evaluation criteria are mainly based on the publication in journals and the impact factors of the journals, which are not suitable for our own situation.

The academic evaluation of the economic studies in Taiwan is mainly based on the publication in journals and the impact factors of the journals. This is mainly because the international evaluation criteria are mainly based on the publication in journals and the impact factors of the journals, which are not suitable for our own situation.

Actually the major publication base for the vast majority of Taiwan’s economic scholars are not foreign publications that make up the above 90% of their publications. However, the degree of evaluation of these studies is relatively limited and there is nothing to speak of in terms of competition. In order Taiwan university’s culture, the local economic society has become a unique Japanese economic society. As for East Asian economic research, the local economic society has become a unique Japanese economic society. As for East Asian economic research, the local economic society has become a unique Japanese economic society. As for East Asian economic research, the local economic society has become a unique Japanese economic society. As for East Asian economic research, the local economic society has become a unique Japanese economic society. As for East Asian economic research, the local economic society has become a unique Japanese economic society.

As for East Asian economic research, the local economic society has become a unique Japanese economic society.

Now let us discuss the criteria for academic evaluation. It is obvious that the criteria of academic evaluation are mainly based on the publication in journals and the impact factors of the journals, which are not suitable for our own situation.

Diverse work, diverse criteria

Within the diverse work and diverse criteria, there are actually many kinds of research. Such research work includes time-consuming, such as long-term maintenance and management, and non-time-consuming, such as teaching and practice, economic policy research. There are all very important, and they have their own value.

Since the humanities and social sciences are affected by the national situation, we have to truly participate in “globalization” to identify our diverse features. It goes without saying that the local humanities and social sciences should serve the needs of local society in the first place. Our society has actually made considerable progress in many areas and should therefore make efforts to deepen its influence. That means more important work, teaching and policy-making should be emphasized.

The problems of (and solutions) for developing countries

As far as the humanities and social sciences are concerned, the influence of the global trend of non-liberalism is evident in many areas. First, it is clear that the humanities and social sciences should serve the needs of local society, and that is the main problem we have to solve. We need to find a new method to serve the needs of local society, and that is the main problem we have to solve. We need to find a new method to serve the needs of local society, and that is the main problem we have to solve. We need to find a new method to serve the needs of local society, and that is the main problem we have to solve. We need to find a new method to serve the needs of local society, and that is the main problem we have to solve.
